

# VvBN PhD-day 2015

## 'Enabling technology for human functioning'

### September 24, Enschede

We are not able to imagine a life without using technology. We use technology for almost every task in our daily life and would not be able to function properly without it. Also in the field of human movement science and its application areas technology is used to a large extent. Think for instance about using technology to analyze our human movement and posture in sports or labor settings, technologic solutions for rehabilitation purposes like robotics and virtual environments or technology to enable monitoring and treatment in the daily environment. The aim of the symposium is to share experiences about the possibilities and current knowledge concerning the use of technology for researching human functioning across the different domains but also to look forward to how technology will influence our world and work as a person.
